

Executive Summary

Fixed income experienced a weaker fourth quarter driven largely by an upward swing in the Treasury yield curve. Inflation trended sideways throughout the quarter, and economic data indicated the U.S. economy remains strong. Despite kicking off a monetary easing cycle in September and cutting the federal funds rate by 25 basis points (bps)* in November and December, the Federal Reserve (“the Fed”) concluded the year on a more hawkish note than markets expected at the beginning of the fourth quarter. Election volatility came and went, but markets have priced in stickier inflation based on the new administration’s proposed policies and on expectations for a continued resilient economy. Against this backdrop, the Victory Core Bond Fund (A Shares, without sales charge) matched the performance of its benchmark, the Bloomberg U.S. Aggregate Bond Index, for the quarter ended December 31, 2024.

Market Update & Commentary

Monetary policy uncertainty and election volatility caused yields to seesaw throughout the fourth quarter of 2024, with the 10-year U.S. Treasury yield beginning the quarter at 3.7% and concluding the year at 4.6%. The YoY Consumer Price Index (CPI) decreased throughout much of the year but rose slightly in the fourth quarter, ending at 2.7%. While not necessarily an indicator that inflation will materially rebound, this gave investors, and the Fed, reasons to reconsider the pace of future rate cuts as the risk of re-acceleration is not zero. Throughout the quarter markets reduced rate cut expectations from six cuts in 2025 to merely two cuts in response to uncertainty surrounding future inflation and a U.S. economy that continues to chug along against previously forecasted odds. Unemployment hovered around 4% during the fourth quarter.

In conjunction with monetary policy, election results and potential policy changes colored market sentiment in Q4 2024. Markets began to price in some of the inflationary risk the shift in political power may bring. This caused the yield curve to shift upward as longer-dated Treasuries crept up and short-term yields came down as a result of the Fed’s widely anticipated interest rate cuts. As the long end of the Treasury yield curve steepened in December, it finally normalized after spending two years inverted. The rise in longer-term yields is largely driven by rising real yields, which indicates to us that investors are better compensated for taking on inflation risk. While fixed income yields are off the peaks we have seen in the past few years, the recent increase offers an attractive entry point for fixed income investors.

Investor compensation for adding credit risk remains low – credit spreads tightened throughout the quarter amidst a strong economic backdrop.

Credit spread levels are a useful pulse check for how the market is perceiving risk, and the historic levels of tightness currently seen demonstrate that fixed income markets are not pricing in a dislocation in the short term. Fixed income yields rose, which drove negative performance across asset classes over the quarter, with credit sectors being the top performers in Q4. Year-to-date fixed income performance was positive across asset classes. The Bloomberg U.S. Aggregate Bond Index concluded the quarter at -3.1%.

* A basis point is one-hundredth of a percentage point (0.01%) and is abbreviated as “bp” (singular) or “bps” (plural).

Portfolio Performance & Positioning

During the quarter, we reduced our allocation to corporate bonds slightly.

Contributors

- Our security selection within corporate credit benefited performance.
- Banking, capital goods, and electric utilities were the best performing sectors.

All investing involves risk, including the potential loss of principal. In addition to the normal risks associated with investing, fixed income securities are subject to interest rate, inflation, credit and default risk. The bond market is volatile. Bonds and bond funds will decrease in value as interest rates rise and vice versa. Credit risk refers to the possibility that debt issuers may not be able to make principal and interest payments or may have their debt downgraded by ratings agencies. High yield securities may be more volatile, be subject to greater levels of credit or default risk, and may be less liquid and more difficult to sell at an advantageous time or price than higher-rated securities of similar maturity. Mortgage-backed securities (MBS) and asset-backed securities (ABS) are subject to credit, prepayment and extension risk and may react differently to changes in interest rates than other bonds. Small movements in interest rates may quickly and significantly reduce the value of certain MBS and ABS. The market value of a security issued on a when-issued, to-be-announced (TBA) or delayed-delivery basis may change before the delivery date, which may adversely impact the Fund's net asset value. There is also the risk that a party fails to deliver the security on time or at all. Derivatives may not work as intended and may result in losses. International investments may involve risk of capital loss from unfavorable fluctuation in currency values, from differences in generally accepted accounting principles or from economic or political instability in other nations. The Fund is also subject to liquidity risk, which is the risk that the Adviser may not be able to sell a security at an advantageous time or price, which may adversely affect the Fund. The value of your investment is also subject to geopolitical risks such as wars, terrorism, environmental disasters, and public health crises; the
